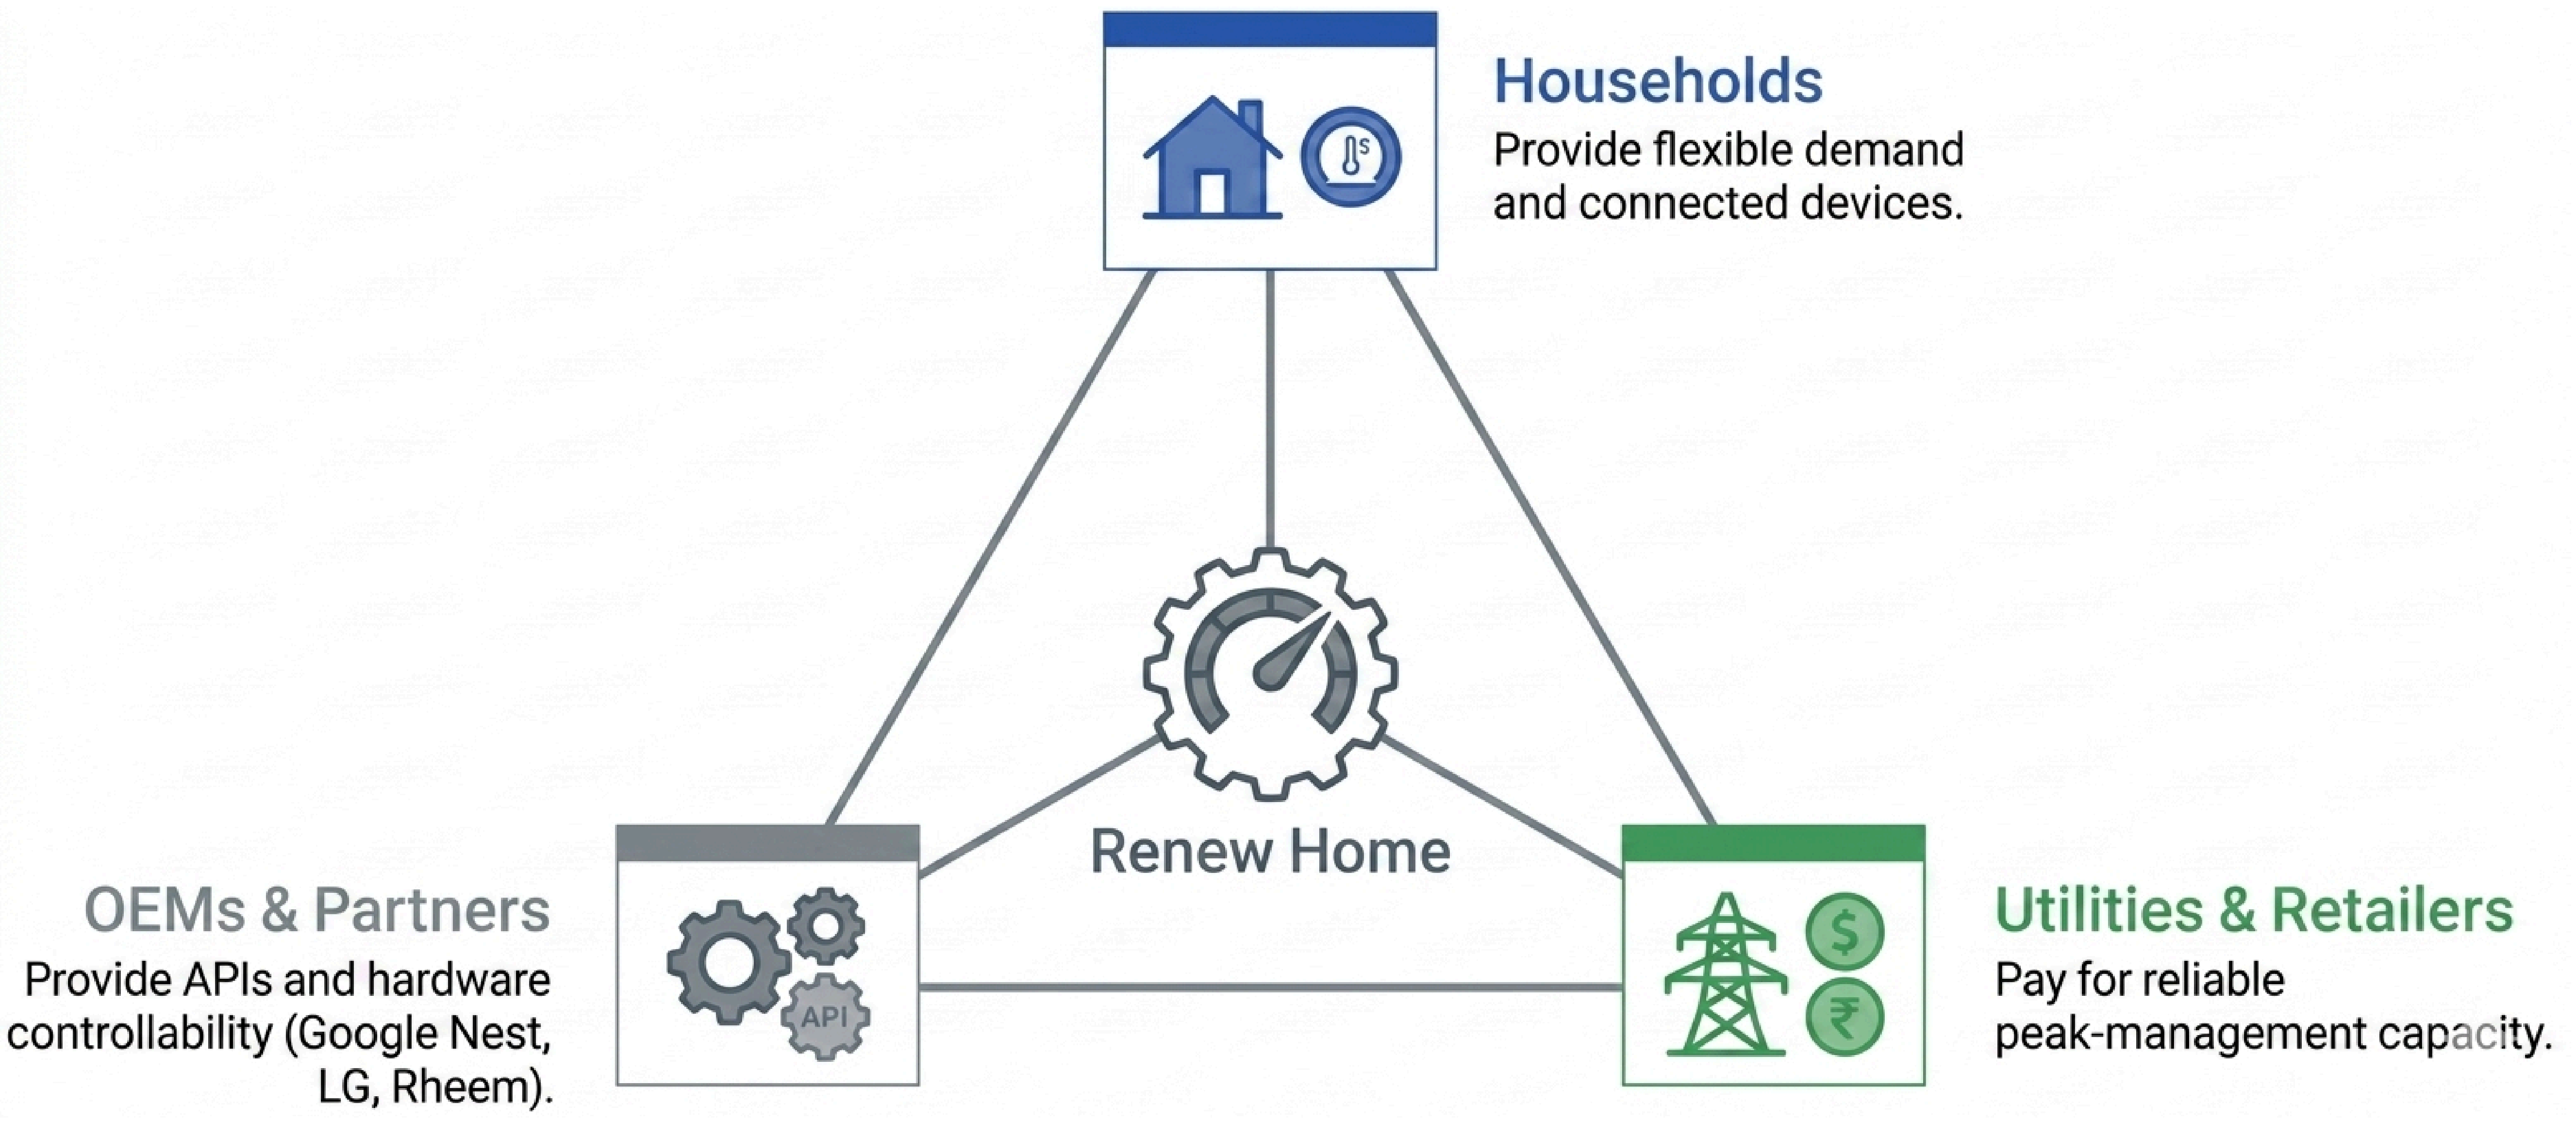
Innovation in Energy Business

The Idea

Orchestrating a Multi-Sided Virtual Power Plant



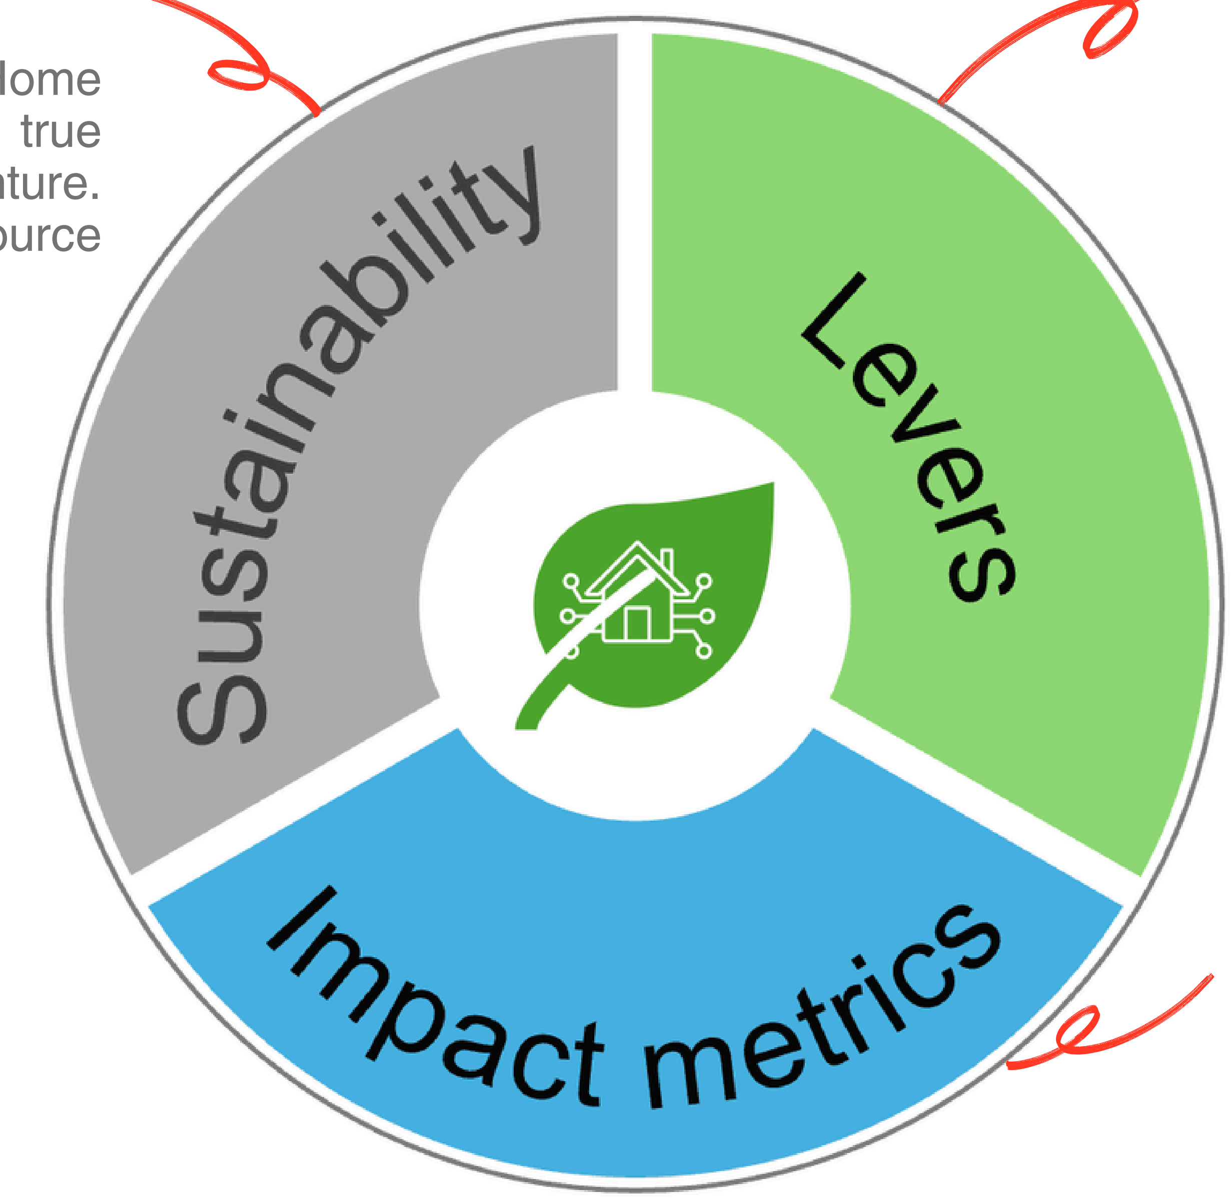
We aggregate micro-shifts in residential energy to create a dispatchable macro-resource.
The result? Gigawatts of clean capacity without building a single peaker plant.

Impact concept

WHERE SUSTAINABILITY IS BUILT INTO THE MODEL

THE MISSION

Renew Home operates as a true sustainability venture. Our goal is resource replacement.



THE ALIGNMENT

Impact is baked into the product design. We don't sacrifice profit for impact; we monetize the impact. Financial growth scales in perfect lockstep with a greener grid.

MEASURABLE OUTCOMES

Every kilowatt of demand shifted by our platform directly replaces a kilowatt generated by an expensive, carbon-heavy peaker plant.

Total addressable market

44–59 Mt
CO_2 AVOIDED / YEAR BY 2050

15–18 Mt
CO_2 AVOIDED / YEAR AT 50 GW (OUR 2030 TARGET)

$10B / year
HOUSEHOLD SAVINGS AT FULL U.S. SCALE

~$100 / year
SAVED PER ENROLLED HOUSEHOLD

$17B / year
POWER-SECTOR CAPEX AVOIDED BY 2030

~50%
CHEAPER THAN UTILITY-SCALE BATTERIES OR NEW PEAKERS

Note: Key figures under the Total addressable market will be tested e.g ~$100/year savings for households

Value Proposition B2C

Product

Gain Creators

- ~$100/year in automatic savings
- Invisible integration — seamless experience inside the Nest/Google Home app
- Real-time savings & CO_2 dashboard visible proof of impact
- Rewards program — earn incentives by participating in grid events

Products and Services

- Compatibility with the smart thermostat the user already owns
- Home energy management platform embedded in smart device apps (Nest, etc.)
- Automated Energy Shifts — AI adjusts heating/cooling at optimal times
- Rewards Shifts — participation in grid-stress events with incentives
- Savings dashboard with real-time bill and CO_2 impact tracking

Pain Relievers

- Zero upfront cost — works with the device the user already has
- Fully automatic — no scheduling, no manual tariff tracking required
- Comfort-first design — user always retains full control and can override
- Proven model — already running on 5M+ homes, removing trust barriers
- Permission-based & transparent

Customers

Gains

- Concrete, visible proof of savings and environmental impact
- Always staying in control — ability to override shifts at any time
- Feeling of contributing to a cleaner grid and a collective movement
- Lower monthly bills with zero effort or lifestyle change
- "Set & forget" experience — no scheduling, no learning curve

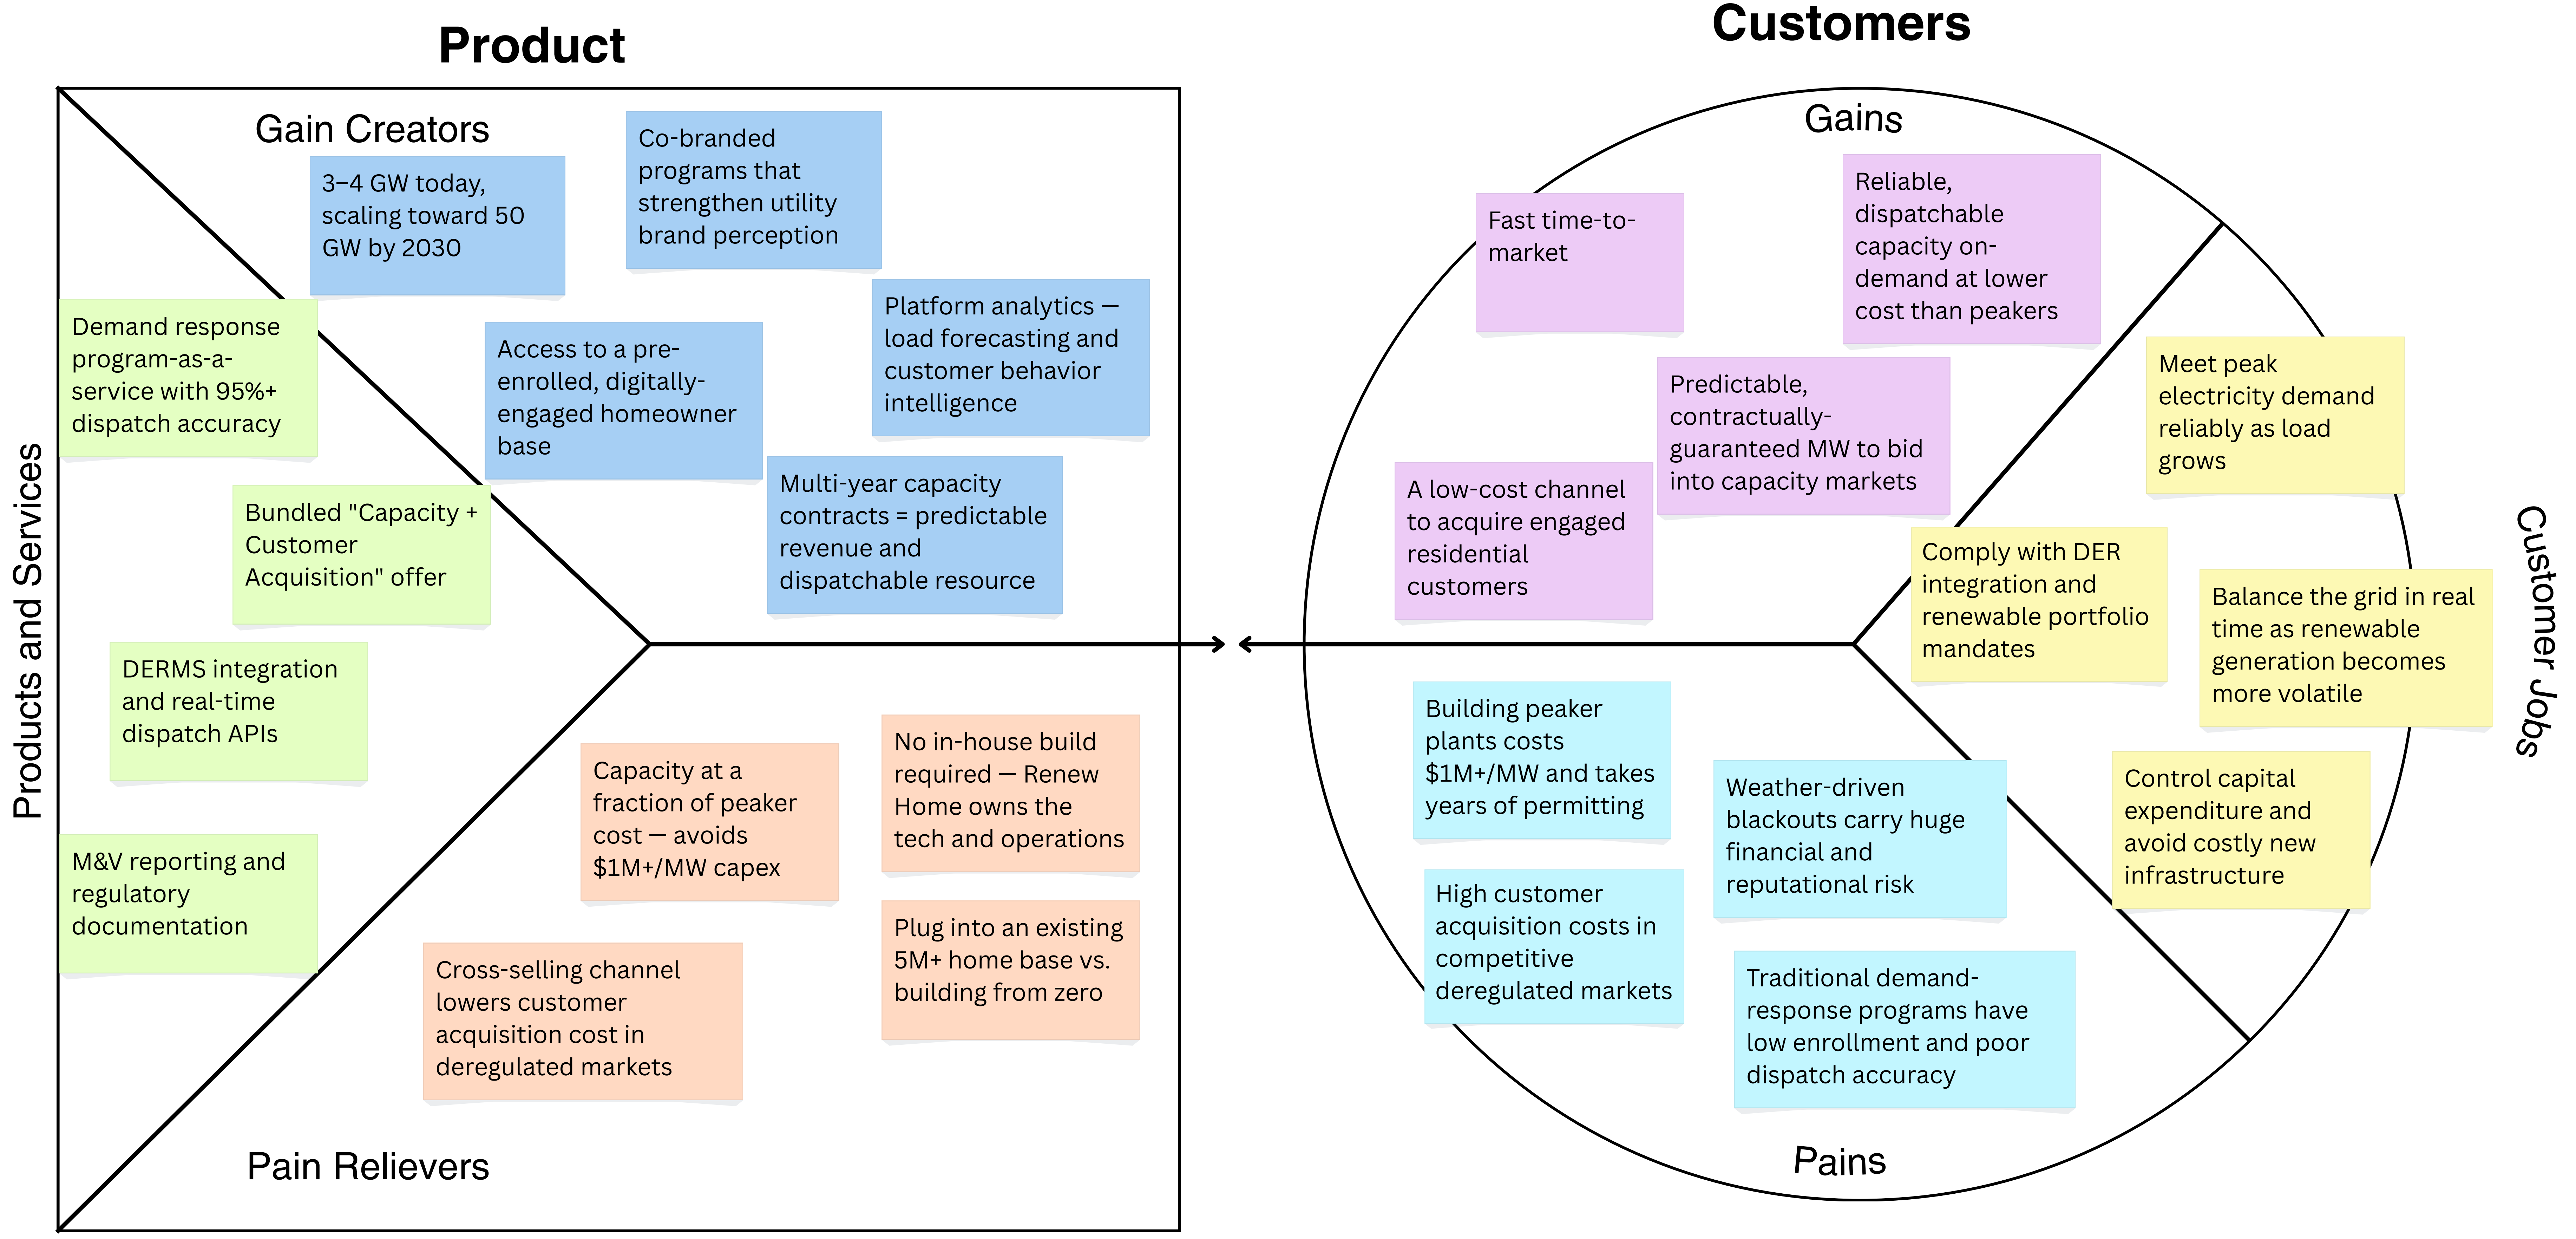
Customer Jobs

- Keep the home comfortable year-round without thinking about it
- Manage rising energy costs within the household budget
- Pay the lowest possible electricity bill each month
- Feel aligned with personal sustainability values
- Make smart use of the technology already installed at home (thermostat, smart devices)

Pains

- Rising and unpredictable electricity bills feel out of control
- Time-of-use tariffs are confusing — hard to know when energy is cheapest
- Distrust of giving a third party remote control over home devices
- Guilt about energy waste but no clear, easy action to take
- Existing utility demand-response programs feel clunky, manual, or intrusive

Value Proposition B2B



Customer Profile - B2B Revenue Engine

Overview

- Investor-owned electric utilities needing peak demand management
- Municipal utilities and cooperatives seeking affordable flexibility
- Grid operators procuring capacity and ancillary services
- Community Choice Aggregators (CCAs) and retail energy providers
- Key Geography: California

Customer Jobs

Important

- Meet peak electricity demand reliably as load grows
- Balance the grid in real time as renewable generation becomes more volatile
- Control capital expenditure and avoid costly new infrastructure
- Comply with DER integration and renewable portfolio mandates

Insignificant

Customer Pains

Extreme

- Weather-driven blackouts carry huge financial and reputational risk
- Building peaker plants costs $1M+/MW and takes years of permitting
- High customer acquisition costs in competitive deregulated markets
- Traditional demand-response programs have low enrollment and poor dispatch accuracy

Moderate

Customer Gains

Essential

- Reliable, dispatchable capacity on-demand at lower cost than peakers
- Predictable, contractually-guaranteed MW to bid into capacity markets
- A low-cost channel to acquire engaged residential customers
- Fast time-to-market

Nice to have

Business Model Canva

KEY PARTNERS

- [B2C] Google Nest: core device, Rush Hour Rewards (1.5M enrolled)
- [B2C] Retailers (Best Buy, Home Depot): device purchase points
- B2C] Sustainability NGOs: credibility & advocacy
- [B2B] 100+ utility partners: DR & capacity contracts
- [B2B] DERMS platform vendors: utility-side software integration
- [B2B] Grid operators (ISOs/RTOs): wholesale market access
- [BOTH] Device OEMs: LG, Honeywell, Ecobee, Amazon, Rheem (300+)
- [BOTH] Google Cloud: AI/data infrastructure

CUSTOMER RELATIONSHIPS

- [B2C] Automated self-service: invisible, always-on
- [B2C] Permission-based and trust-first: easy opt-out
- [B2C] Community-driven: collective impact story
- [B2C] Light gamification: rewards, badges, comparisons
- [B2C] Personalized notifications on savings & events
- [B2B] Co-design of tariffs & programs with utilities
- accuracy, M&V
- [B2B] Regulatory and policy support: PUC filings
- [B2B] Bundled contract: capacity + customer acquisition

KEY ACTIVITIES

- [B2C] User onboarding, engagement & retention
- [B2C] UX design of app & savings dashboard
- [B2C] User acquisition marketing
- [B2B] VPP dispatch & real-time orchestration
- [B2B] Load forecasting & M&V reporting
- [B2B] Utility program design & tariff co-dev

CHANNELS

B2C

- Embedded in OEM apps (Nest, Google Home)
- Co-branded utility enrollment programs
- Online store for discounted thermostats
- Digital marketing: social, Google Ads, content
- Referral program
- Retail partnerships at device purchase point

B2B

- Co-branded DR & VPP programs
- Integration with existing utility DERMS
- Industry conferences & trade events
- In-app cross-promotion in deregulated markets

KEY RESOURCES

- [B2C] 5M+ connected households (network-effect asset)
- [B2C] Brand & consumer trust for automated control
- [B2B] Aggregated flexible load: 5M homes as dispatchable resource
- [B2B] Regulatory expertise & 100+ utility relationships
- [B2B] Exclusive Google Nest partnership for scale

CUSTOMER SEGMENTS

B2C

- US home with smart thermostat
- Cost-conscious in high-rate states (California)
- Age 30–55, working professionals with annual income between $90k - $180k living in suburban areas in California
- Early adopters of smart home technology

B2B

- Investor-owned utilities: peak demand mgmt
- Municipal utilities & coops: affordable flexibility
- Grid operators: capacity & ancillary
- CCAs & retail energy providers

VALUE PROPOSITION

B2C: THE ACQUISITION OFFER

- Save ~$100/yr automatically, zero cost, existing thermostat
- "Set & forget", no scheduling, no learning curve
- Comfort-first: user stays in control, can override anytime
- Transparent dashboard: real-time savings + CO_2 impact
- Rewards for participating in energy events

B2B: THE REVENUE OFFER

- Flexible, dispatchable grid capacity at 4 GW scale
- Avoid $1M+/MW peaker plant CAPEX & multi-year permitting
- 95%+ dispatch accuracy via AI orchestration
- Risk transfer, Renew Home owns tech & operations
- Bundled offer: MW flexibility + engaged homeowner base

COST STRUCTURE

- [B2C] Customer acquisition cost — digital marketing, referrals
- [B2C] Rewards & incentives to homeowners (variable, funded by B2B)
- [B2B] Platform operations and cloud infrastructure, real-time dispatch at scale
- [BOTH] Software development & engineering (largest cost item)
- [BOTH] API integration with OEM partners

REVENUE STREAMS

- B2C: Free
- B2B (45%): Capacity payments — $/MW-year for guaranteed dispatchable capacity
- B2B (30%): Demand response events — $/kWh shifted during grid-stress moments
- B2B (20%): Wholesale capacity markets — aggregated load into ISO/RTO auctions
- B2B (5%): Ancillary services & program design fees

Key Hypotheses

1

B2C Adoption

We believe homeowners with smart thermostats will adopt a free, automatic energy-saving service because it delivers ~$100/year in savings without sacrificing comfort or requiring any effort.

2

B2B Willingness-to-Pay

We believe utilities in deregulated markets will pay a premium for bundled Capacity + Customer Acquisition contracts because acquiring residential customers costs them $150–300 per household

3

Partner Dependency

We believe Google Nest and other OEMs will keep granting us preferred API access because embedded energy-saving features differentiate their devices and increase customer loyalty

4

Technology Scalability

We believe our AI dispatch platform can scale from 5M to 50M+ homes while maintaining 95%+ accuracy because our algorithms improve as data grows and cloud infrastructure scales elastically.

Discover and Validation Experiment

Hypothesis	Discovery	Validation	Success Criteria
B2C Adoption	25–30 interviews with smart-thermostat owners + low-fidelity landing page mock-up.	Live landing page with 2-week ad campaign. Measure signups & "Connect Nest" clicks.	≥8% conversion ≥500 leads.
B2B Willingness-to-Pay	8–10 interviews with utility procurement leads in TX & NY on the bundled offer.	Offer a 6-month paid pilot to 2 utilities (10 MW + referral program). LOI as commitment.	≥1 signed LOI in 90 days.
Partner Dependency	5–8 interviews with Nest, Ecobee, LG PMs + desk research on OEM roadmaps.	Request written 24-month API partnership agreement from ≥1 OEM.	≥18-month written commitment secured.
Technology Scalability	Expert interviews + simulation stress-test at 10× current load.	3-month dispatch pilot on 500K-home subset during peak season.	≥95% accuracy, <200ms latency.
